

MailActive

In businesses today email is the mission-critical communications tool that allows their people to produce the best results. This greater reliance on email has increased the number of messages sent and received, the variety of work getting done and even the speed of business itself.

Amid this change, employee expectations have also evolved. Today, employees look for rich, efficient access to email, calendars, attachments, contacts and more - no matter where they are or what type of device they are using. SevenC's MailActive delivers a message system that addresses these needs.

Advantages

- Complete messaging platform for your company employees

- Built-in protective technologies to keep your business moving, reduce spam and viruses, enable confidential communications, and help your company to be compliant
- Centralised storage and management of all Email
- Bandwith conservation through the effective delivery of local mail
- Safe remote access to Email
- Full Disaster Recovery Plan
- Regular updates and system enhancements at no extra cost
- Proactive and reactive ongoing support for all Email queries
- Detailed reporting at the server, domain and mailbox levels to provide insight into mail server performance.

MailActive

Sending, receiving, and storage of users' electronic email:

The MailActive email server downloads all email originating from the Internet on behalf of the users, thereby removing the need for users to download their email individually. Users' incoming Internet email is usually first captured by one of SevenC's Internet hosting servers. The MailActive server then fetches all these captured email messages at configurable time intervals.

Store-and-forward email service:

The mail service is facilitated through the careful integration of Sendmail, Uucp, Dovecot, SevenC's MailScanner-7C, NameD for DNS, SevenC's Nova7, Syslog, Cron, F-Prot, ClamAV, and other sub-systems.

Local versus remote email delivery:

The MailActive server distinguishes between "local" and "remote" delivery of email. Local email will be delivered on the MailActive server without incurring bandwidth traffic across the Client's Internet link.

MailActive comprises a collection of enhancements to Sendmail, namely:

- MaPolice: Real-time spam and virus filtering, general email size control
- MaPolicy: Per-user email policy management and mail
- MaArchive: Per-user email archiving
- MaNova7: Bulk distribution of configurable mailshots
- MaStat: Live graphical reports of email traffic
- Webmail7: Remote access to email
- Group7: Company-wide shared appointments, contacts database, tasks, and timesheets

MailActive supports all standard email clients like Microsoft Outlook, Pegasus, Netscape Communicator, Mozilla, Thunderbird or Apple Entourage, as well as the delivery of mail to all Smartphone email clients.

Features

- Full hardware, installation and maintenance plan
- Unlimited onsite mailbox size
- Support for multiple mailboxes within your own domain
- Internet and Intranet POP3/SMTP mailserver and client
- Supports both POP and IMAP
- Central server platform which is proven immune to virus infection
